

What's new in Birdstep RDM Embedded 7.2?

RDM Embedded is a powerful, cross-platform, small footprint database designed for resource constrained environments with demanding performance requirements. RDM Embedded legacy has 20+ years of history, over 20 million installations, and more than 20 000 developers; the product has found itself successfully embedded into applications in all major industries.

The competitive edge RDM Embedded gives embedded applications is its extreme transaction rate and complex data modeling capabilities, solving the most complex applications without draining power or resources.

The database offers a strong foundation for application development with tools for performance enhancement and database customization. RDM Embedded v7.2 continues this legacy by adding critical features for many users and developers.

New features added to this release include:

Active-Passive Replication – Fault tolerant and highly available applications need to rely heavily on efficient and scalable data redundancy systems. With the introduction of the RDM Embedded state of the art replication engine, a 99.999% uptime can be guaranteed out of the box. Multiple slaves are also supported allowing for complex replication models, increasing uptime, data redundancy and data availability.

64 Bit File Addressing – RDM Embedded has been architected to allow storage of data in multiple files avoiding the traditional file system limits. Cognizant of advances in applications storage requirements, Birdstep has with this release extended the addressable database size by leveraging 64 bit file system addressing.
